Essential Information

GCSEs Through Time

1951 - O Level replaces CSE

1988 - GCSEs replace O Level

2016 - Reformed GCSEs (less coursework)

2020 - GCSE exams replaced by CAGs
(Centre Assessed Grades)

2021 - Government plan to continue with
exams (contingency plans to be confirmed)

Old grades	New grades
A*	9
A	8
A	7
B	6
C	5 STRONG PASS
C	4 STANDARD PASS
D	3
E	2
F	
G	1 PASS
U	U FAIL

Year 11 Exam Season

- The GCSE exam season for Year 11 pupils usually runs for approximately 3 weeks before May half term and 3 weeks afterwards.

Normal Arrangement for Exams	1	2	3	May Half term	4	5	6
------------------------------------	---	---	---	---------------------	---	---	---

- Exams are scheduled by the Exam Boards for everyone in the country.
- They are set as either AM* or PM** exams.

*AM exams start at 9:00am. Pupils need to be at school at 8:30am to go to the toilet, organise their equipment, fill up their clear drinks bottle, hear some last minute top tips and drop their coats, bags, mobile phones and watches off, before heading into the exam room at 8:50am.

**PM exams start at 1:00pm. Pupils need to be getting ready in their lunch break from 12:30pm, then dropping off their things, before heading into the exam room at 12:50pm.

Exam Preparation

- You will have a large number of exams scheduled in the 6 week period. The exact number will depend on the subjects you have chosen, but there are many situations where pupils will have two (or sometimes three) exams on the same day
- This means that you won't have the opportunity to spend a few days preparing for each exam (cramming into short term memory). Revision therefore needs to be spread out and sustained over a long period of time gradually building up the information in your long term memory.
- In the final few weeks before the exams it is best to create a revision timetable, to map out the revision tasks for each subject (e.g. Biology 5x Past paper Exam Qs on Unit B7) and time for rest and relaxation activities (e.g. sports, walk dog, meet up with friends).

How Memory Works

COGNITIVE LOAD THEORY: KEY TERMS

by @inner_drive | www.innerdrive.co.uk

Working Memory

This is where we hold and process new information. It has a small capacity. If information is not transferred to long-term memory from here, it will be forgotten.

Cognitive Load

A person can only process so much information at once. Too much information can lead to cognitive overload, which hinders how much can be transferred from working memory to long-term memory.

Long-Term Memory

This is where we store the things we have learnt. It has a huge capacity, meaning we can remember things from a long time ago. Connecting information from our working memory to our long-term memory is how we learn new things.

The redundancy effect

When students are presented with unnecessary information, it clogs up their working memory. This means they may remember the irrelevant information and forget the information you want them to learn.

The split attention effect

When students have to process two or more sources of information simultaneously in order to understand the material, it places a burden on their working memory. The cost of switching between the sources means students remember less of the content.

COGNITIVE LOAD THEORY: KEY TERMS

by @inner_drive | www.innerdrive.co.uk

The limits to working memory (also known as short term memory) mean that you are not able to store enough (cram) in order to complete an exam.

This is why your teachers ask for a quiet, focused environment; we want people to focus on the important information, no distractions.

Working Memory

This is where we hold and process new information. It has a small capacity. If information is not transferred to long-term memory from here, it will be forgotten.

Cognitive Load

A person can only process so much information at once. Too much information can lead to cognitive overload, which hinders how much can be transferred from working memory to long-term memory.

The redundancy effect

When students are presented with unnecessary information, it clogs up their working memory. This means they may remember the irrelevant information and forget the information you want them to learn.

Long-Term Memory

This is where we store the things we have learnt. It has a huge capacity, meaning we can remember things from a long time ago. Connecting information from our working memory to our long-term memory is how we learn new things.

The split attention effect

When students have to process two or more sources of information simultaneously in order to understand the material, it places a burden on their working memory.

The cost of switching between the sources means students remember less of the content.

For exam success, material needs to be in long term memory. Retrieval practice helps to transfer material to your long term memory

This is why it is important to focus exclusively on study - not a mobile phone, or TV show, or music

How does memory work?

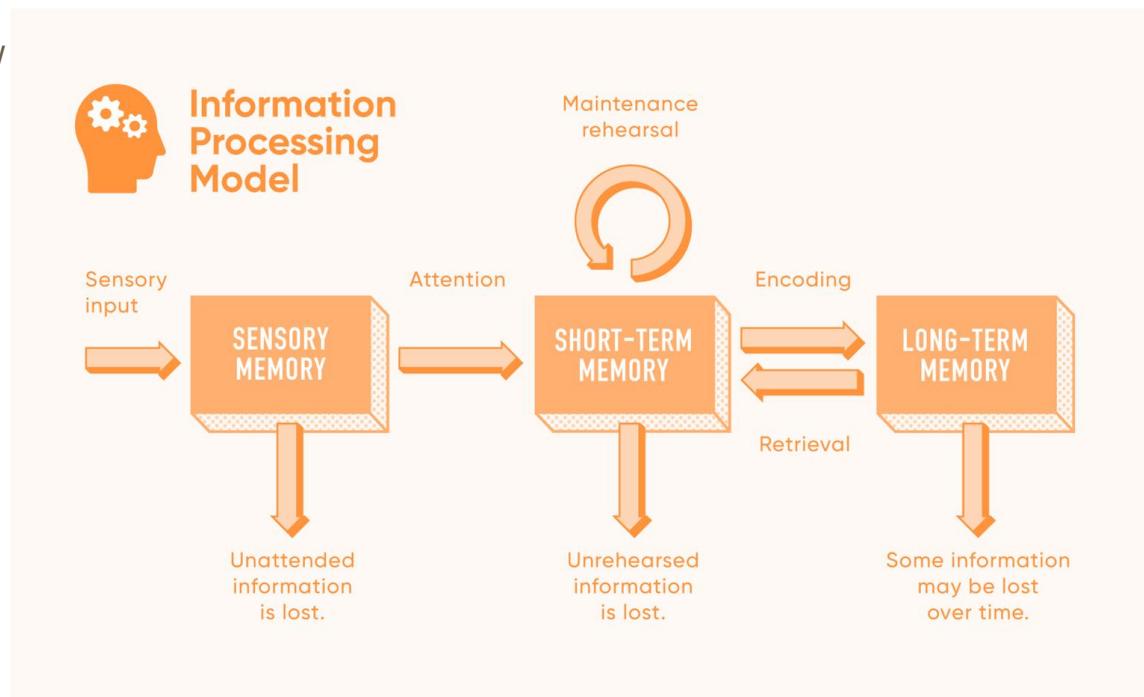

Sensory input = seeing and hearing new information (e.g. teacher explaining)

Attention = focusing attention on the teacher explanation

Rehearsal = practising the new information (e.g. answering questions)

Encoding = storing the image as image, sound or semantic (meaning)

Retrieval = using flash cards or completing past paper questions to recall information from memory

Short Term/Working Memory

You may have tried this in your PSHCE lessons...

Try your best to remember these words.

Read these words:

- Nine
- Swap
- Ring
- Bird
- Clock
- Army
- Bank
- Fire
- Apple
- Table

Cover the words over.

1. What was the 4th word?
2. What was the 8th word?
3. - Now, keeping the words covered, write down as many words as you can remember

Testing yourself is a much better way of remembering things, than just reading the words

Short Term/Working Memory

How did you get to the fourth word? What about the eighth word?

Short term memory is stored and retrieved sequentially - when trying to find the fourth word, the brain begins at the first word and goes through them to find the fourth word.

Short term memory also has a capacity limit of around 7 items. How many words could you remember from the list?

Try this:

<https://www.youtube.com/watch?v=l6TrsYI1Grk> (pause after each set of numbers)

Apply this to your situation:

You will receive a provisional exam timetable. Looking at the provisional exam timetable -

- How many exams do you have in close proximity?
- Are there any days you will have two exams on one day?

What challenges might this place on your memory?

What problems would you have if you only relied on your short term memory?

So what's the solution?

Short term memory is limited (can you remember the fifth number sequence...?)

It can hold between 5 and 9 items at any one time, and if not actively rehearsed, it will lose the memories within seconds.

This is why, when we remember something longer (e.g. a phone number), we break it into chunks (e.g. 07675 819 454) - three chunks are easier than eleven numbers.

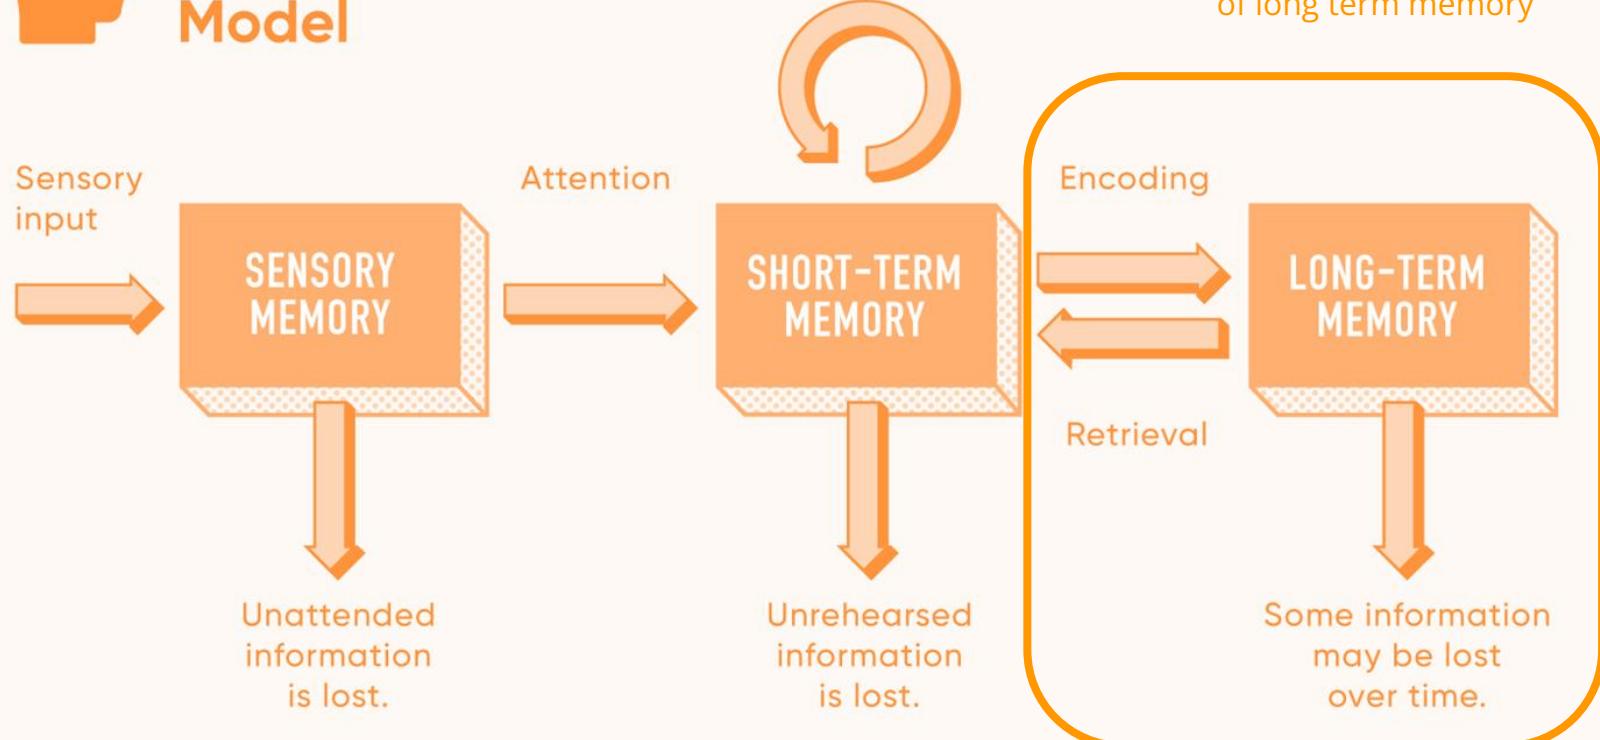

The route to success in your GCSE exams is to transfer the information from short term to long term memory.

Long term memory is unlimited; there is no limit to the volume of information it can store, however to keep memories available and accessible, they need to be regularly recalled.

This is why you can easily remember the lyrics to a song you haven't heard for years (it was regularly recalled when you first heard it).

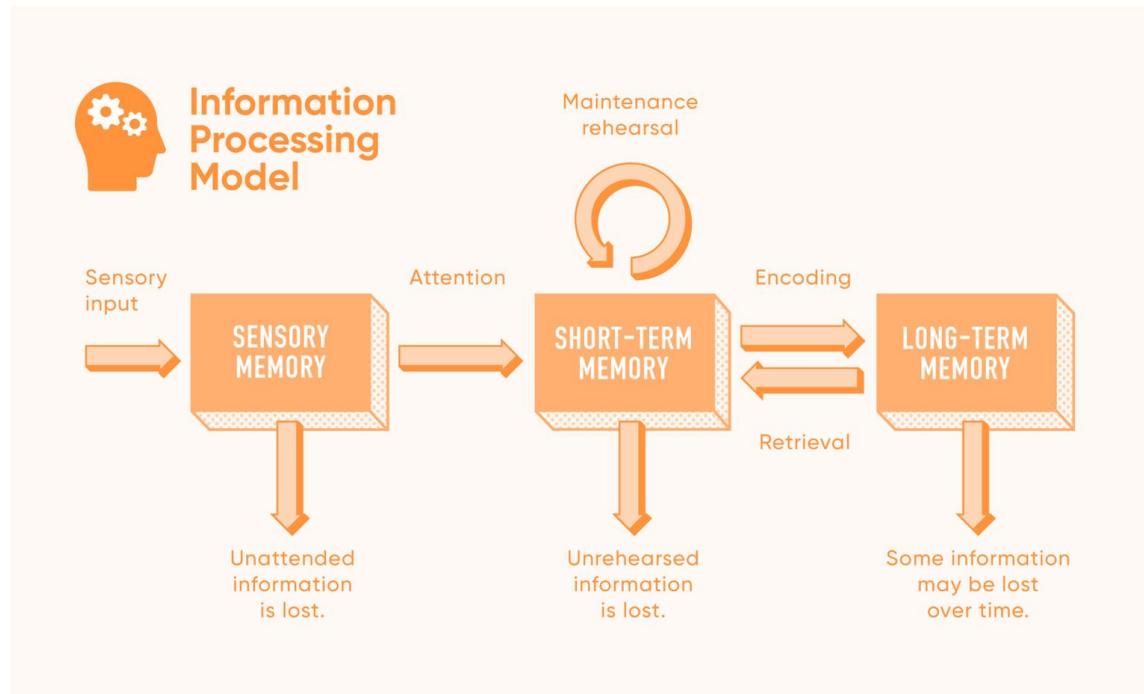

Information Processing Model

So...what does work?

To be successful in your GCSEs, you need to:

1. Focus your attention on getting the information from your teacher
2. Practise (rehearse) with the new information in class
3. 'Revise' at home using retrieval practice to retrieve and encode the information into long term memory

Effective Revision

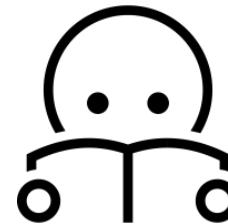

The Research - what doesn't work well?

Mnemonics
Use of key terms/
acronyms to
remember
concepts

Highlighting
The use of
highlighters or
underlining while
reading

Re-reading
Revisiting text
that has already
been read

Summarising
Writing
summaries of
concepts or topics

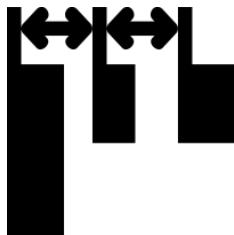

The Research - what does work well?

Retrieval practice

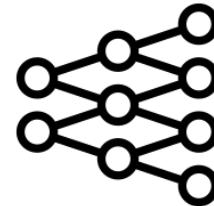

Self-testing, using flashcards or practice exam questions

Spaced (distributed) practice

Spreading study out over a period of months

Elaboration

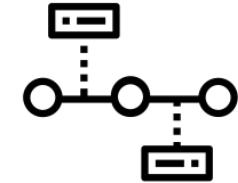

Thinking about the 'why' behind your answer - explaining your response

Interleaving

Developing a schedule that mixes different kinds of problems

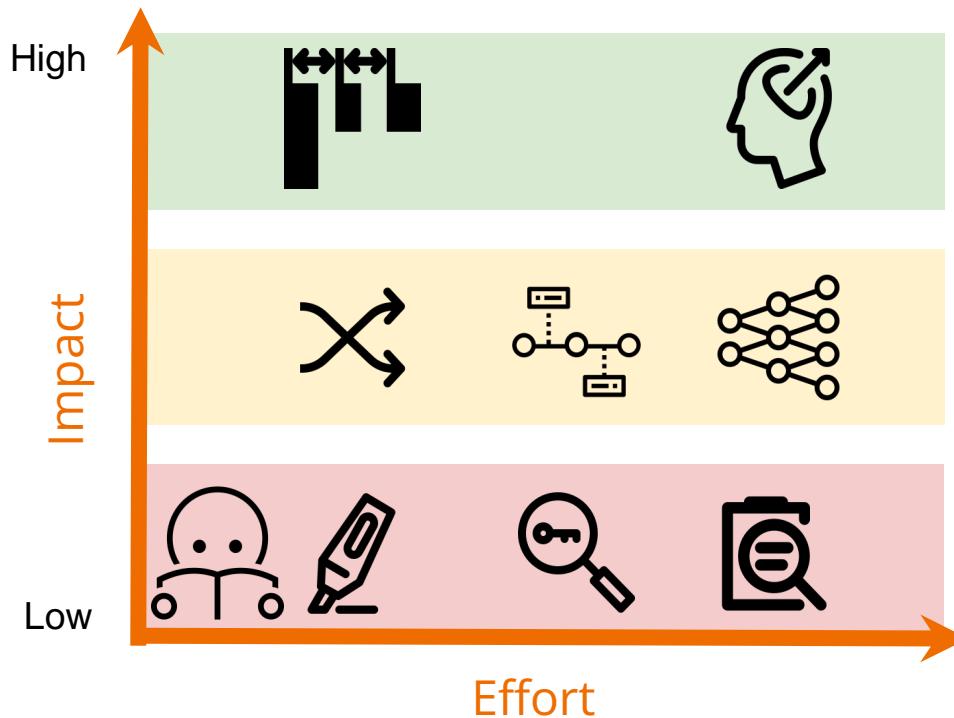

Dual coding

Using text and images together to aid understanding (e.g. timeline)

The Research

Retrieval Practice

Recreating something you've learned in the past from memory

Thinking hard to retrieve something you learned a while ago

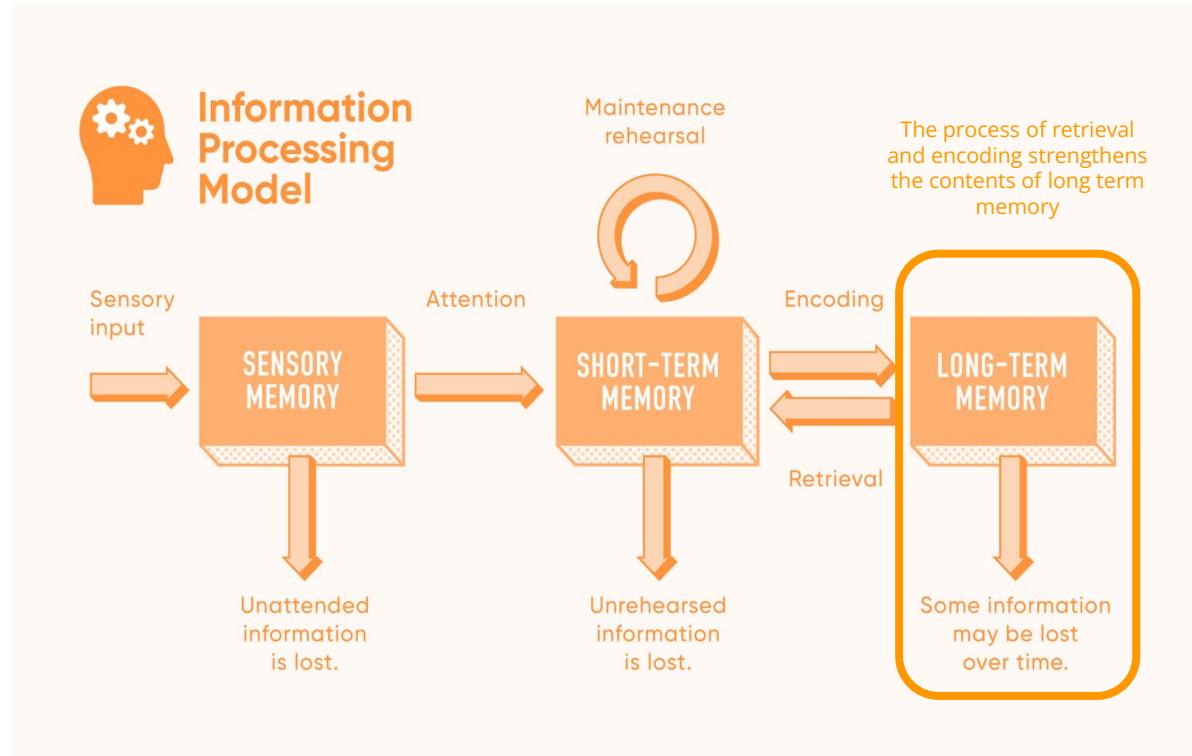

Increases ability to retrieve information in exams

Revision should involve practising output, not input

The act of retrieving information from memory, practising with it and then transferring it back to long term works to **strengthen** the memory.

This is why revision should be about getting information **out** rather than putting more information **in**.

(Unless you haven't learned the information in the first place... in which case you need to complete all three stages of memory coding)

**So...what is retrieval practice
and how do we do it?**

Retrieval Practice (the Testing Effect)

<https://www.youtube.com/watch?v=rFIK5gutHKM>

Recognition vs Recall

Recognition only requires you to identify the correct answer.

It is a 1 step process - recognise the answer from the list.

Recognition is a fairly simple task - all you have to do is look at something and generate the feeling of familiarity.

In your exam you don't get marks for things being familiar, you get marks for recalling relevant information and using it to answer the question.

Recall requires you to retrieve information from memory - a skill you will need in every exam.

It is a 2 step process - you have to generate a mental list and recognise the correct answer from the list.

While recognition (*highlighting key points, doing a multiple choice quiz etc*) feels more familiar and comfortable, it doesn't do a lot to help with your memory.

Recall (*gap fill, creating mind map, answering practice exam questions*) is far more effective.

Retrieval and Recall

Retrieval practice involves three steps:

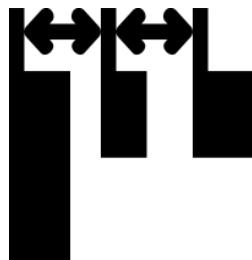

1. Recalling information from memory
2. Selecting the relevant information
3. Doing something with that information.

Examples include:

- Flash cards
- Past paper questions
- Practice questions from textbooks
- Creating a mind map or graphic organiser (e.g. timeline)
- Interactive platforms e.g. Seneca Learning

Spaced Practice

The opposite of cramming

Spacing out study episodes over time so you learn for the long term, rather than forgetting

Spaced Practice

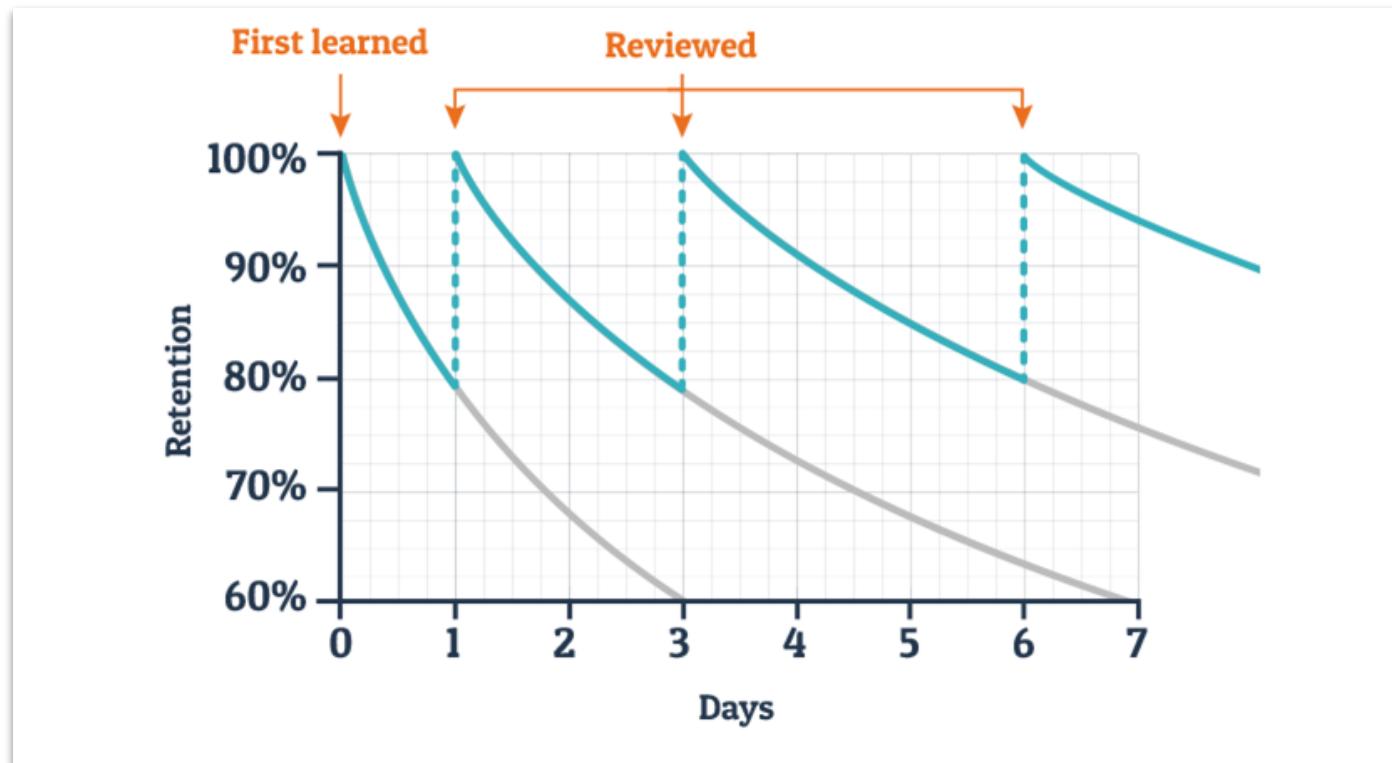

Another solid piece of revision advice is to space your practice out, rather than cramming it all together.

If you organise five hours of study into one hour a day, you'll remember more than if you study for five hours on one day. Yet time and time again we don't do this – and the cause isn't just being disorganised.

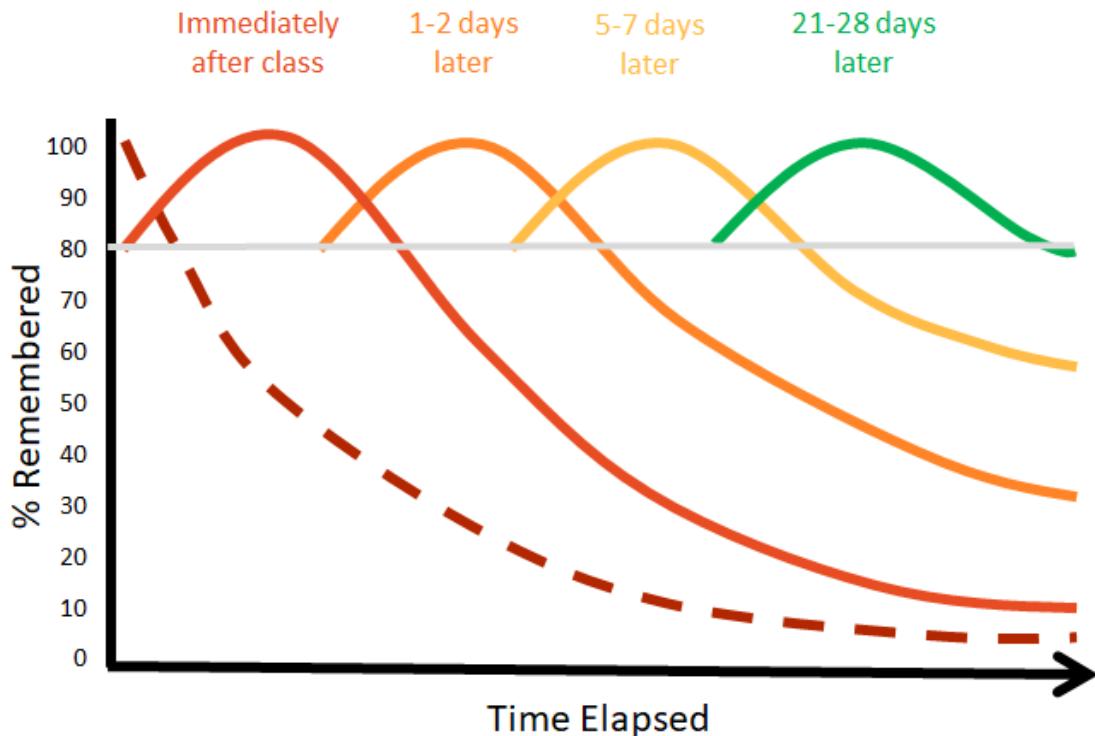

Cramming all your study together feels good. You finish the study session, thinking "I know this". The problem is that although you're currently holding it in short term memory therefore the memories are more fragile and will fade away.

Spacing your practice out doesn't feel as satisfying, but it results in memories that are more likely to be useful when exam day comes around.

Ebbinghaus' Forgetting Curve

Beating the Forgetting Curve

The original forgetting curve is shown in the dotted line - look how much less is lost after each recall session.

Each 'recall' session (immediately after class; 1-2 days, 5-7 days, 21-28 days) could be completed by self testing, using flashcards, creating a mind map of knowledge or completing the relevant section on Seneca Learning.

Cognitive Load Theory

instructional designers
can reduce cognitive
load and...

Cognitive Load Theory describes how much the brain can store before it becomes overwhelmed with information. This video gives a brief (30 second) overview.

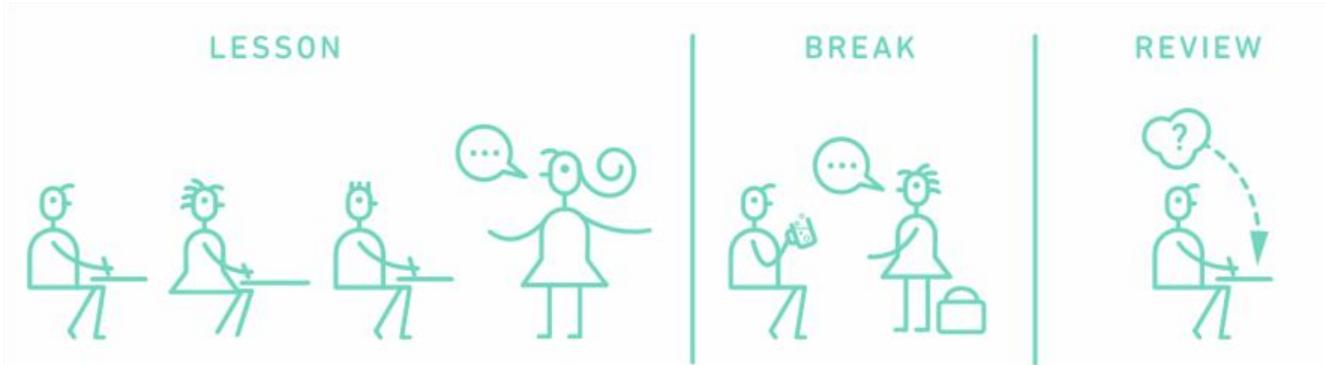

What is the link between Cognitive Load Theory and spaced practice?

How would cramming impact on your cognitive load?

<https://www.youtube.com/watch?v=h-dkuiKLIUA>

Spaced Practice - Methods

- Set aside time each day, even if your exams are months away
- Attend lessons, leave a gap of a few days, then review information
- It may feel difficult, and you may forget some information, but this is a good thing as it forces you to retrieve from memory

Resource: Seneca Learning

A screenshot of the Seneca Learning platform. At the top, there is a search bar with the text 'Search' and a magnifying glass icon. Below the search bar is a navigation menu with icons for Home, Lessons, Quizzes, and Help. The main content area features a mind map with a central node 'States of matter' connected to three branches: 'Solid' (with a green line), 'Liquid' (with a blue line), and 'Gas' (with a red line). A small icon of a notepad and pen is located to the left of the mind map. Below the mind map is a text input field with the placeholder 'Type your answer here...'. At the bottom of the screen is a teal footer bar with the text 'Seneca Learning' and a copyright notice '© 2023 Seneca Learning Ltd'.

A screenshot of the Seneca Learning platform. At the top, there is a search bar with the text 'Search' and a magnifying glass icon. Below the search bar is a navigation menu with icons for Home, Lessons, Quizzes, and Help. The main content area features a question card with the text: 'Sulfur's melting point is 115°C, and boiling point is 445°C. Which of these are correct?'. Below the text are four options in a grid: 'Liquid at 200°C' (correct), 'Gas at 200°C', 'Solid at 500°C' (incorrect), 'Gas at 500°C', 'Liquid at 100°C' (incorrect), and 'Solid at 100°C'. At the bottom of the screen is a teal footer bar with the text 'Seneca Learning' and a copyright notice '© 2023 Seneca Learning Ltd'.

A screenshot of the Seneca Learning platform. At the top, there is a search bar with the text 'Search' and a magnifying glass icon. Below the search bar is a navigation menu with icons for Home, Lessons, Quizzes, and Help. The main content area features a quiz card with the title 'Changes of state' and a sub-question 'What type of change is a change of state?'. The correct answer 'Physical' is selected in a green box. Below the quiz card is a summary card for a 'Review session' with the title '1.1.2 Changing State', a knowledge score of '21.9K', a completion status of '100%', a duration of '04min 05s', and a 'Share' button. At the bottom of the screen is a teal footer bar with the text 'Seneca Learning' and a copyright notice '© 2023 Seneca Learning Ltd'.

A screenshot of the Seneca Learning platform. At the top, there is a search bar with the text 'Search' and a magnifying glass icon. Below the search bar is a navigation menu with icons for Home, Lessons, Quizzes, and Help. The main content area features a course structure card for 'Combined Science Chemistry: AQA Gateway (A) GCSE Foundation'. The card includes a circular icon with a sparkler, the course title, and a list of sections: '1 Particles' (1.1 Particle Model, 1.1.1 States of Matter, 1.1.2 Changing State), '2 Atomic Structure' (1.2.1 Model of the Atom, 1.2.2 Subatomic Particles, 1.2.3 Isotopes & Ions). To the right of the course structure are several circular icons, some of which are filled with different colors (green, blue, red, yellow).

How to deal with exam stress

Explore this website:

<https://www.bbc.co.uk/bitesize/articles/zsvcqhv>

Get started with **THE POMODORO TECHNIQUE**

- 1 Identify your tasks for the day
- 2 Set a timer for 25 minutes
- 3 Work for the duration of the timer
- 4 Take a five minute break

★ After every fourth break, take a longer break of 15-30 minutes

Causes of Stress

- Pressure from outside about importance of exams
- Uncertainty about the exam questions
- Unfamiliar surroundings and people overseeing the exams
- Concern about what others will say if they don't do well
- Lack of confidence about revision techniques and whether they're revising effectively
- Feeling that teachers and other adults don't understand stress.

Helping a Friend

- Listen to how they are feeling
- Reassure them that this stressful period is only temporary
- Help them to take some time out to have fun
- Let them know that you're there for them if they need to talk

It's okay not to be okay

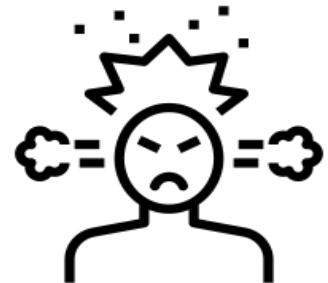

Sleep issues

Difficulty
concentrating

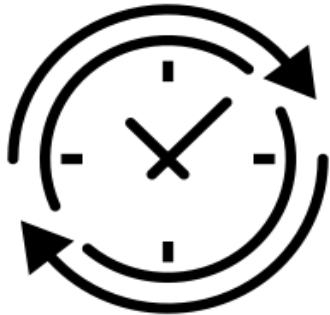

Negative
behaviour
changes

Increased
irritability

Quick wins

Alter the
routine

Alter the
environment

Change what
you are doing
